

Descriptives for Displacement Analysis Sample

1 Summary Statistics

Start by clearly defining your sample and summarizing the baseline characteristics. Stata's `table` command is used to create the tables in this section.

Here is a standard summary table, showing sample characteristics in the baseline year (year prior to event, both treatment and control) over time.

Table 1: Summary Statistics in Baseline Year over Time

	1993	1999	2004
Birth Year	1949.38 [6.96]	1957.55 [8.31]	1963.62 [8.46]
Age	43.62 [6.96]	41.45 [8.31]	40.38 [8.46]
Female	0.35 [0.48]	0.42 [0.50]	0.31 [0.47]
Years of Schooling	11.11 [2.12]	11.31 [2.26]	11.32 [2.19]
Earnings	6585.85 [1734.01]	7965.30 [2255.34]	9083.83 [2943.75]
Log Earnings	8.76 [0.27]	8.94 [0.29]	9.06 [0.33]
Employed	1.00 [0.00]	1.00 [0.00]	1.00 [0.00]
Firm size	473.30 [419.34]	466.11 [406.40]	607.36 [507.07]
Number of Observations	80	170	128

Next, we create a summary table with overlapping columns (that is not mutually exclusive), showing the sample characteristics of the all workers as well as the treatment and control groups.

Table 2: Summary Statistics by Displacement Status

	All workers	Non-Displaced	Displaced
Birth Year	1956.7 [9.3]	1956.7 [9.3]	1956.7 [9.3]
Age	41.6 [8.3]	41.6 [8.3]	41.6 [8.3]
Female	0.4 [0.5]	0.4 [0.5]	0.4 [0.5]
Years of Schooling	11.5 [2.3]	11.5 [2.3]	11.5 [2.3]
Earnings	8077.0 [2384.7]	8077.0 [2384.7]	8077.0 [2384.7]
Log Earnings	9.0 [0.3]	9.0 [0.3]	9.0 [0.3]
Employed	1.0 [0.0]	1.0 [0.0]	1.0 [0.0]
Firm size	548.2 [465.2]	548.2 [465.2]	548.2 [465.2]
Number of Observations	1,680	1,680	1,680
Number of Establishments	94	94	94

Notes: Average characteristics of individuals. Standard deviations in brackets.

Next, we create a table summarizing the distribution of the variables of interest. We report the 10th, 25th, 50th, 75th, and 90th percentiles, min, max, as well as the mean and standard deviation. Looking at details like this can often catch problems with the data cleaning or the data itself.

Table 3: Summary Statistics with Percentiles

	10th pct	25th pct	50th pct	75th pct	90th pct	Min	Max	Mean	SD	N
Birth Year	1944.00	1949.00	1956.00	1964.00	1969.00	1938.00	1976.00	1956.66	[9.34]	1,680
Age	30.00	34.00	42.00	49.00	53.00	28.00	55.00	41.60	[8.31]	1,680
Female	0.00	0.00	0.00	1.00	1.00	0.00	1.00	0.37	[0.48]	1,680
Years of Schooling	8.00	10.00	12.00	14.00	15.00	8.00	15.00	11.51	[2.27]	1,680
Earnings	5241.45	6180.79	7806.81	9645.89	11246.21	3580.61	22614.19	8077.01	[2384.67]	1,680
Log Earnings	8.56	8.73	8.96	9.17	9.33	8.18	10.03	8.95	[0.29]	1,680
Employed	1.00	1.00	1.00	1.00	1.00	1.00	1.00	1.00	[0.00]	1,680
Firm size	141.02	214.83	399.93	649.30	1179.89	61.27	2323.09	548.17	[465.15]	1,680

Next, we create a table showing the industry composition of the sample. This is a simple table showing the percentage of workers in each industry for the treatment and control groups. This should be perfectly balanced by construction but it is a good check to make sure that the matching is working.

Next, we create descriptive figures showing the evolution of some key variables by year.

Table 4: Industry Distribution by Displacement Status

	Non-displaced	Displaced
Mining	13.9	13.9
Construction	8.8	8.8
Manufacturing	12.5	12.5
Health	14.4	14.4
Finance	20.8	20.8
FCSL	17.7	17.7
Professional Services	11.8	11.8
Total	100.0	100.0

Table 5: Number of Workers by Industry and Year

	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Mining	14	26	38	4	30	10	12	6	14	34	30	16
Construction	2	30	22	4	24		10	4	8	20	12	12
Manufacturing		22	38	14	38	6	38	16		16	8	14
Health	12	32	28	14	46	6	28	2	10	32	18	14
Finance	12	44	38	24	48	14	48	28	4	36	24	30
FCSL	20	16	50	6	56	20	16	10	4	34	32	34
Professional Services	20	12	30	12	26	12	18	10	12	28	10	8

Notes: Each cell shows number of workers per cell

2 Consistency Checks

Figure 1: Consistency Checks

(a) Counts by Year

(b) Earnings by Year

(c) Log Earnings by Year

(d) Log Earnings Percentiles by Year

(e) Employment by Year

(f) Displaced by Year

3 Treatment and Control around Displacement Event

Now we create a set of figures showing the treatment and control groups around the displacement event. Given the matching design, this already allows us to get a good sense of the treatment effect. Looking at the raw means like this is often a much better way to understand what is happening then going straight to the eventstudy.

Figure 2: Treatment and Control around Displacement Event

4 Spousal Outcomes around Displacement Event

This section shows spousal earnings and employment trajectories for displaced versus non-displaced workers' spouses.

The added worker effect (AWE) refers to the labor supply response of spouses when the primary worker experiences job displacement.

Matching is done exactly on whether the spouse is employed at baseline, and within cells we also match on spouse baseline log earnings using propensity score matching.

Note on zero baseline earnings: About 40% of spouses have zero earnings at baseline. For these spouses, earnings growth ($\frac{y_{i,t}-y_{i,-1}}{y_{i,-1}}$) is undefined. Log earnings figures condition on positive spouse earnings. Spouse employment and earnings in levels include all observations.

Table 6: Spouse Summary Statistics by Displacement Status

	All workers	Non-Displaced	Displaced
Spouse Age	41.7 [8.7]	41.7 [8.8]	41.7 [8.7]
Spouse Female	0.6 [0.5]	0.6 [0.5]	0.6 [0.5]
Spouse Years of Schooling	11.7 [2.7]	11.6 [2.6]	11.7 [2.7]
Spouse Earnings	3384.2 [3704.5]	3366.9 [3759.6]	3401.5 [3650.7]
Spouse Log Earnings	8.4 [0.6]	8.4 [0.6]	8.4 [0.6]
Spouse Employed	0.6 [0.5]	0.6 [0.5]	0.6 [0.5]
Number of Observations	1,680	840	840

Notes: Average characteristics of spouses at baseline. Standard deviations in brackets.
